The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haemastopolesis regulating activity, tissue growth activity, haemastopolesis regulating chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                      W09904265-A2

```
The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and the name cancer and cancer.

The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol. function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone action and as catalysts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mice which are the fi progeny of a cross of NZB and NZW parents (Portanova et al., J. Immunol. 1144, 4633, 1990). The known epitope consists of ca. 10 amino acids at the N-terminus of the histone HZB protein. To make mRNA encoding candidate polypeptides a 5 fixed sequence composed of a T7 promoter sequence and a ribosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes, terminating in a restriction endonuclease site is synthesised and cloned using a number of oligonucleotides (example shown). A 3 fixed sequence is placed into a restriction site to provide an mRNA encoding the C-terminal trailer sequence of ca. 100 nucleotides lacking stop codons. In addition, a 3 primer annealing site is provided so that cDNA synthesis can be accomplished on the mRNA recovered from partitioned ribosome complexes. See also Q38845-63.

                                                                                                                                                                                                                                                                                                                             CC Q73500 shows the Pseudorables virus (PRV) large latency transcript CLLT). The basic sequence is derived from PRV strain InFh and PRV CC strain Ka. The LLT overlaps and is transcribed in the opposite CC orientation with respect to the EPO (early polypeptide 0) and the CC immediately early gene (IE180). EPO is nonessential for replicatio, CC LLT is the only gene expressed during PRV latency, and the IE180 CC gene is absolutely necessary for PRV replication. However there are CC 2 copies of IE180 in the genome. It is expected that PRV lacking one CC of the IE180 copies is viable. Deletions in the non-overlapping CC regions of these 3 genes will generate single deletion routants, CC while deletions in overlapping regions will generate double deletion CC mutants. The invention is concerned with the construction of attenuated CC viruses which have a reduced ability to reactivate from latency. This CC can be achieved by functionally disabling the expression of the EPO CC gene, or by disrupting the synthesis of the LLT, or both. (See also CC Q73501 and R60620-24)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF66, ORF67 which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF69, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF73 which encodes immediate early protein (IEP), K14 which encodes OX-2 (V-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGARAT, K15. KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, and for detecting expression of a DNA virus associated with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 32207 BP; 7229 A; 9156 C;

```
the Kaposi's sarcoma-associated herpes virus (KSHY). KSHY is also known as human herpes virus 8 (HHV8). This sequence contains the DNAs of the Ci invention which encode KSHY polypeptides selected from: (a) viral CC macrophage inflammatory protein (MIP) II: (b) viral interleukin-6; (C) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein CC encoded by ORF63. Labelled probes for the nucleic acid, proteins encoded by Lt, and antibodies (Ab) specific for the proteins are useful for CC detecting HHV8, specifically for diagnosis of Kaposi's sarcoma, in body CC fluids or tissue samples. HHV8 infections can be treated with antisense CC or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHV8 infection, while the protein can be used in protective vaccines. Ab may also be used CC office that by the protective vaccines. Ab may also be used CC office that pumphomas, and HHV8 may be implicated in many other lymphomas, and HHV8 may be implicated in many consistency of a patient of cells and animals containing the CC used as targets for antiviral drugs, e.g. dihydrofolate reductase gene can be inhibited with methotrexate. These can also be used to determine CC the immune status of a patient infected with HIV. HHV8 derived protein CC used in the containing the used as an anti-inflammatory agent for, core, treating rheumatoid arthritis. This sequence is stated as containing CC on the protein can be used as an anti-inflammatory agent for, containing the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10-OCT-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a fragment of the genomic sequence containing the coding region for the mouse WRN gene (M83004). The corresponding human gene (M8301) encodes a protein related to Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (MS), an autosomal recessive disorder with a complex phenotype
                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Fig 7; 153pp;

                                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                                                                                                                       CC This is a nucleotide sequence of the stabilising sequence-encoding CC insert. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or CC inserting onto or into the core protein a stabilising polypeptide of CC formula [(Glya)X(Glyb)Y(Glyc)Z]n where Glya, Glyb, Glyc are 1-6 CC sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, CC Phe, Pro or Thr and n can be anything between 1-65, X, Y and Z need not CC encoding the stabilising polypeptide can be linked onto or inserted into CC a nucleic acid encoding a core protein. The fusion proteins of the CC invention are more resistant to degradation by proteases and, thus, have CC a longer half-life than the unfused core protein. The products can be used for treating autoimnume diseases, cancer and inflammation. In CC particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein CC which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in vivo imaging.
                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           멍
      The present sequence is an anti-sense strand of commercially available plasmid pcMYEBNA from which Epstein Barr Virus Nuclear Antigen 1 (EBNA 1) encoding DNA is obtained. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orif) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-sense strand; plasmid pCMVEBNA; EBNA 1; episome; transfection; Epstein Barr Virus Nuclear Antigen 1; origin of replication; EBV orip; eucaryotic host cell; recombinant cell line; ion channel; multiple gene expression; receptor; transporter protein; gene therapy; transcription factor; adhesion molecule; antisense therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 16; Page 43-50; 63pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method of the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ruffner

In these methods, polycationic agents are used to increase the frequency of uptake of a nucleic acid (see also V21684-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the gene therapy of many diseases.

The cell is used to assay a test compound for its effect on a G_iPCR. The method and cells are useful for assaying agonist and antagonist compounds, which bind to G_iPCR which, stimulate intracellular calcium mobilization, such as the nociceptin receptor, and particularly chemokine receptors such as CCR3, CCR2 and the interleukin 8 receptor type B. The present sequence represents the nucleotide sequence of the pCEP4 vector.

/note="Organ: brain; Vector: pBluescript SK- (Stratagene);
Site_1: EcoRI; Site_2: XhoI; Double-stranded cDNA was
prepared from human oligodendroglioma using primer
5'-GAAGAGAGAGAGAGAACTAGATCTGAGT(18)-3'. An EcoRI
adaptor was used on the 5' end of the cDNA as follows:
5'-AATTCGGCACGAC-3'. The library was size-selected and
went through one round of amplification. Average insert
size is 1.7 kb, with a range from 0.4-12 kb. Tumor
identification by consensus pathology; contains
chromosome ip and 19q deletion as determined by CGH. This
library was constructed by Dr. Martin Schiller (Johns
Hopkins University)."

products

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions the invention product as a produc

The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, activin/inhibin activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotides encoding human secreted proteins e.g. human blood, kidney, foetal lung, placenta, test ovary, pituitary, retina and colon cDNA libraries.

The specification describes antisense oligonucleotides (X52869-X55271) CC directed against at least 2 mRNAs selected from target genes, coding and connecting regions of RNAs corresponding to target genes, gene cointitation codons, genomic flanking regions, intron-exon borders, the confidence of the juxta-section between coding and non-coding cregions and all segments of RNAs encoding proteins associated with one cor more diseases, conditions or mixtures. The antisense oligonucleotides cor more diseases, conditions or mixtures. The antisense oligonucleotides cor more diseases, conditions or mixtures. The antisense oligonucleotides cor more diseases, pulmonary value and for the antisense correctment of diseases and conditions. Typical diseases and conditions correctment of diseases and conditions. Typical diseases and conditions correctment of diseases and conditions. Typical diseases and conditions correctment of diseases, pulmonary vasoconstriction, inflammation, corrective correct asthma, allergies, asthma, impeded respiration, crespiratory distress syndrome, pain, cystic fibrosis, pulmonary corrective corrections of the pulmonary vasoconstriction, emphysema, chronic obstructive correct, hepatocellular carcinoma, kidney cancer, melanoma, hapatic corrects hepatocellular carcinoma, kidney cancer, melanoma, hapatic correct metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
CC The specification describes antisense oligonucleotides (X52869-X55271) CC directed against at least 2 mRNAs selected from target genes, coding and cnon-coding regions at least 2 mRNAs selected from target genes, coding and conding regions are solding regions, intron-exon borders, the coding regions and all segments of RNAs encoding proteins associated with one coding solding and non-coding complete and selected selected with one coding be derived from sequences X55272-74. These multiple target colligonucleotides (specifically X55180-271) can be used for the antisense coding unuleotides (specifically X55180-271) can be used for the antisense coding unuleotides (specifically X55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions care those associated with impaired respiration and inflammation, coding lung diseases, pulmonary vasoconstriction, inflammation, coding lung diseases, pulmonary vasoconstriction, inflammation, coding lung diseases, pulmonary vasoconstriction, emphysema, chronic obstructive hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, coding cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  104237
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           104177
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pulmonary hypertension; pulmonary vasoconstriction; emphysema;
